B. Sreeja

BBA graduate in Banking and Finance | Finance Portfolio overview

BBA in Banking and Finance, Jain (Deemed-to-be University), Bangalore, 2022 to 2025 (CGPA 8.52). Three Excel projects built on real listed-company data, covering FP&A, credit analysis and valuation. Looking for an opportunity to grow as a finance professional. Mumbai, India.

The three projects

Project	Finance question	Headline result
1. Nestlé India FP&A model	Did FY26 deliver its budget, and what drove the EBITDA gap?	Sales +3.3% vs budget but EBITDA -1.4%; materials the largest cost drag
2. Tata Steel credit dashboard	How strong is the credit after a loss-making cycle?	Gross debt/EBITDA 3.9x to 2.7x; scorecard 2 of 6, Elevated Risk
3. HDFC Bank valuation	What is the bank worth, and do two methods agree?	Rs. 523 vs Rs. 692.80 price; DDM equals excess return value

Skills demonstrated

- **Excel:** formula-driven models, SUMPRODUCT, scenario analysis, linked dashboards, conditional formatting, charts
- **FP&A:** budget vs actual, EBITDA bridge, flexed budget, cost-head analysis, forecast cross-checks
- **Credit analysis:** coverage, leverage, net debt, cash-flow metrics, Altman Z-Score, risk scoring
- **Valuation:** CAPM, residual income, DDM, sensitivity analysis
- **Modelling practice:** inputs linked to a raw-data sheet, check cells, assumptions and limitations documented
- **Other skills (not used in these projects):** SQL, Power BI

Certifications

- MS Excel: Beginner to Advanced
- Advanced Excel (Udemy)
- Excel Using AI (Be10x workshop)
- Financial Analyst
- SQL
- Power BI
- All certificates: https://drive.google.com/drive/folders/1JCll-19izYLuRreAwXWRq5XqFog0jLwt

Data and how to review

Each workbook contains a Raw_Data sheet: the unedited Screener.in export (downloaded Nov 2026). Every input on the Historicals sheet is a formula linked to it, and the same exports are in the repository as separate files. Colour code: blue = input, black = formula, green = link, yellow = key assumption. Company data is real; budgets, forecasts and valuation assumptions are my own exercises.

1. Nestlé India: FP&A Budget vs Actual and FY27 Forecast

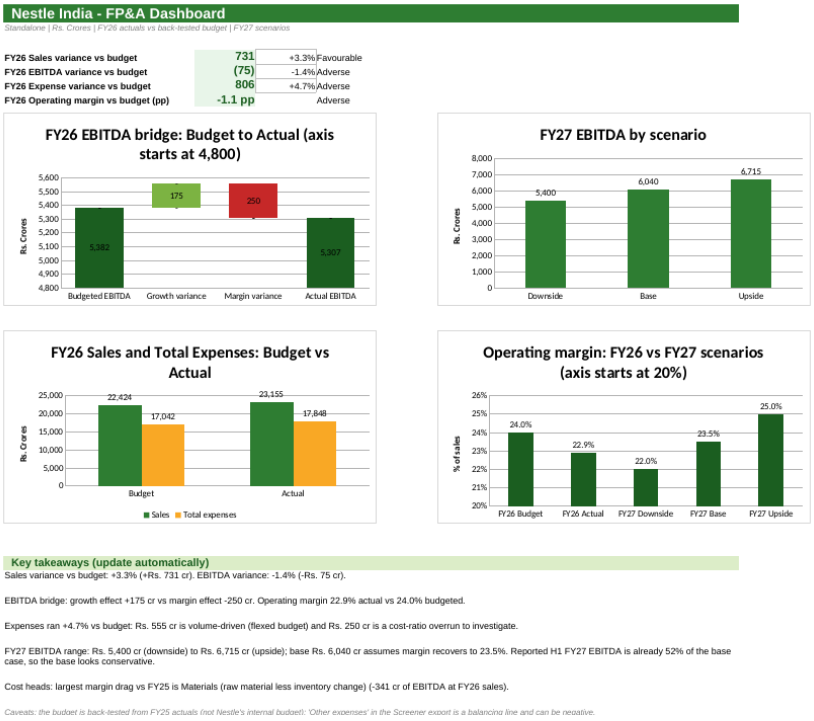

Workbook: https://github.com/sreeja-243/finance-portfolio/blob/main/nestle_fpa_model.xlsx
Download: https://github.com/sreeja-243/finance-portfolio/raw/main/nestle_fpa_model.xlsx
Raw data: https://github.com/sreeja-243/finance-portfolio/blob/main/Raw_Data_Nestle_India.xlsx

A driver-based FY26 budget compared with actuals, an EBITDA bridge, a flexed-budget expense split, cost-head analysis and a three-scenario FY27 forecast (standalone, Rs. crore).

+3.3% | -1.4%	FY26 sales | EBITDA vs budget (+Rs. 731 cr | -Rs. 75 cr); margin 22.9% vs 24.0%
-Rs. 250 cr	Cost-ratio overrun; Rs. 555 cr of the 4.7% expense overrun is volume-driven
-Rs. 341 cr	Materials: the largest cost drag vs FY25 (37.2% to 38.6% of sales)
Rs. 6,040 cr	FY27 base-case EBITDA (range 5,400 to 6,715); reported H1 FY27 is already 52% of it

- EBITDA bridge: +Rs. 175 cr growth effect, -Rs. 250 cr margin effect; reconciles to reported EBITDA.
- FY27 base: 11% growth, 23.5% margin; downside 6% / 22.0%; upside 16% / 25.0%. H1 FY27 actuals suggest the base case is conservative.

Limitations: the budget is back-tested from FY25 actuals, not Nestlé's internal budget; Screener's 'other expenses' line is a balancing item and can be negative.

2. Tata Steel: Ratio Analysis and Credit Risk Dashboard

Workbook: https://github.com/sreeja-243/finance-portfolio/blob/main/tata_steel_credit_dashboard.xlsx
Download: https://github.com/sreeja-243/finance-portfolio/raw/main/tata_steel_credit_dashboard.xlsx
Raw data: https://github.com/sreeja-243/finance-portfolio/blob/main/Raw_Data_Tata_Steel.xlsx

Profitability, leverage, coverage and cash-flow ratios with an Altman Z-Score and a rule-based scorecard, FY22 to FY26 (consolidated, Rs. crore).

2 of 6	Risk scorecard, FY26: Elevated Risk
3.9x to 2.7x	Gross debt / EBITDA, FY24 to FY26 (net of cash 3.5x to 2.4x)
4.8x | 3.1x	FY26 interest coverage, EBITDA basis | EBIT basis
1.74	Altman Z-Score on book equity (2.07 on market cap); distress below 1.81

- Net profit: Rs. 40,154 cr (FY22), Rs. 4,437 cr loss (FY24), Rs. 10,794 cr (FY26); net margin -1.9% to 4.6%.
- Operating cash flow covers 38% of gross debt, up from 23% in FY24.

Limitations: free cash flow is a proxy (operating + investing cash flow); days payable are not calculated; no current/quick ratio; only Altman's cut-offs come from the literature.

3. HDFC Bank: Excess Return Valuation with DDM Cross-Check

Workbook: https://github.com/sreeja-243/finance-portfolio/blob/main/hdfc_valuation_model.xlsx
Download: https://github.com/sreeja-243/finance-portfolio/raw/main/hdfc_valuation_model.xlsx
Raw data: https://github.com/sreeja-243/finance-portfolio/blob/main/Raw_Data_HDFC_Bank.xlsx

A bank-appropriate valuation using the Excess Return Model, a DDM that reconciles to it exactly, and a sensitivity grid that re-runs the full model (consolidated, per share in Rs.).

Rs. 523	Intrinsic value per share vs Rs. 692.80 market price (-24.5%)
1.37x vs 1.82x	Intrinsic vs market price-to-book
12.65%	Cost of equity (6.8% risk-free, 0.9 beta, 6.5% ERP); terminal growth 5.5%
Rs. 443 to 660	Sensitivity range (Ke 11.65% to 13.65%, g 4.5% to 6.5%); none reaches the market price

- The DDM equals the Excess Return value once terminal payout is set to 1 - g/ROE (63.3%): the main modelling insight.
- FY26 ROE computed from the data is 13.7%; the forecast assumes a recovery to 15.0% with 30% payout.

Limitations: beta of 0.90 is an assumption (an observed beta of 0.42 was found unusually low); FY24 onward reflects the HDFC Ltd merger; educational exercise, not a price target.

HDFC Bank — Valuation Summary

Headline Output

Current Market Price (Rs., Screener export, Nov 2026)	692.80	
Intrinsic Value: Excess Return Model (Rs.)	**523.00**	
Intrinsic Value: DDM Cross-Check (Rs.)	523.00	Reconciles to ERM
Market P/B (x) = price / book value per share	1.82x	
Intrinsic P/B (x)	1.37x	
Upside / (Downside) vs Current Price	**-24.5%**	

Read: the model values the bank at Rs. 523 vs a market price of Rs. 693 (-24.5%). The market pays 1.8x book; a ROE of 15% against a 12.7% cost of equity justifies 1.4x. The result is driven mainly by cost of equity (beta 0.9, ERP 6.5%) and the ROE recovery path; the grid below shows where the market price would be justified.

Sensitivity: Intrinsic Value per Share (Rs.), full Excess Return Model

Each cell re-runs the full 5-year Excess Return Model for the Ke and g shown (not a one-stage shortcut), so the centre cell equals the headline value. Green = at or above market price, red = below.

Ke (down) / g (across)	4.5%	5.0%	5.5%	6.0%	6.5%
11.65%	595.37	607.92	622.51	639.69	660.19
12.15%	549.41	558.48	568.93	581.07	595.35
12.65%	509.26	515.68	**523.00**	531.42	541.21
13.15%	473.90	478.27	483.22	488.85	495.34
13.65%	442.55	445.33	448.45	451.98	456.00

Check: centre cell equals headline value (reconciles)

Key Assumptions Used

Cost of Equity (Ke)	12.65%
Terminal Growth (g)	5.50%
Steady-State ROE	15.0%
Terminal Payout Ratio = 1 - g / ROE	63.3%
Starting Book Value / Share (Rs.)	380.72

Portfolio piece demonstrating bank-specific valuation methodology (Excess Return / DDM), not investment advice. All blue-and-yellow inputs on the Assumptions sheet can be changed and the whole model, including the grid, updates.
